

Types of Patient Lifts

ELECTRIC

Designed for residents who cannot support their own weight.

- Can lower to assist fallen residents off the floor
- Vertical style lifts residents straight up and down for easier positioning

SIT-TO-STAND

Made for residents who can bear at least some of their own weight.

- More dignified and conducive to resident involvement
- Features a small footprint for easy storage

NON-POWERED (MANUAL)

For residents requiring minimal assistance.

- Allows for quick and easy transfers
- Features a compact design
- No batteries required

BATHING

Made for residents who need assistance with bathing.

- Allows for efficient transfers by gently and safely lowering or raising residents into or out of a tub or bathing area

Glossary

CRADLE POINTS

Sling attachments. Lifts typically accommodate slings with four or six cradle points.

BASE WIDENING

- Powered base widening only requires the push of a button
- Manual base widening, whether by hand shift or foot pedal, places some strain on the caregiver

BASE CLEARANCE

To maximize effectiveness, consider the base clearance of your lifts to ensure they fit under existing beds.

BASE LENGTH AND WIDTH

Shorter base lengths and widths allow a lift to be used in tight spaces. The base of the lift should open wide enough to fit around the equipment a resident is being transferred to or from.

HEIGHT RANGE

Full travel height range allows lifting from the floor.

Important Sling Information

There are a number of full body slings with a variety of characteristics. Take note of each sling's:

- Weight capacity
- Material construction
- Size
- Number of hookup points

Other considerations include:

- Padding
- Brushed lining to prevent sliding
- Stretch resistance
- Positioning strap
- High back section
- Head support
- Waist belt
- Commode opening

See our full-line Catalog V65, pages 1702-1714, and our Healthcare Catalog V10, pages 46-59, for our complete selection of lifts and slings.
